## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 118, *Compressors and pneumatic tools, machines and equipment*, Subcommittee SC 3, *Pneumatic tools and machines*.

# Hand-held portable power tools — Test methods for evaluation of vibration emission —

## Part 2: Wrenches, nutrunners and screwdrivers

### AMENDMENT 1: Changes in Annex C — Brake devices

*Page 26, Annex C*

Replace the existing Annex C with the following:

#### **Annex C**

(normative)

#### **Brake devices — Assembly specification and example drawings of parts**

This annex gives requirements for the brake and also examples of brake designs.

##### **C.1 Specification of brake device**

The requirements on the brake system are:

- The size of the sockets should be according to [Figures C.1](#) to [C.5](#). The reason is to define the weight of the sockets.
- The static friction coefficient of the brake shall not exceed the dynamic friction coefficient with more than 20%.
- The brake force should not vary more than 20 % over a test run. This is obtained if the brake design uses conical disc springs. If other design is used, the variation in brake force needs to be verified by measurement.
- The mounted test rig shall not have any resonances within the frequency range for hand-arm vibration that could influence the test results. This can be assured by bolting the base frame to a concrete block having a mass of at least 400 kg.

Page 39, Annex D

The following new Annex D has been added:

#### Annex D

(informative)

#### Drawings, example of brake blocks

Example of brake block design:

- a steel base for mounting the brake and supporting the inner brake block;
- a pair of brake blocks for example aluminium blocks with a lining on the cylindrical surface (see [Tables D.1](#) and [D.2](#) footnotes);
- a steel plate which supports the outer brake block;
- two cover plates made of steel;
- a socket that is rotated by the machine;
- bolts, nuts and spring washers used to apply the contact pressure between the socket and the brake block;
- mounting screws for stopping the axial movements of the socket.

The conical disc spring shall be mounted in suitable directions to give an appropriate contact pressure, i.e. such that they are half-compressed when the specified rotational frequency is reached.

Intense use of the brake device may necessitate the introduction of air cooling by the addition of a small hole in the lower cover plate.

<sup>a</sup> Solid block of phenolic cotton laminate (fine grade), or aluminum block with a lining on its cylindrical surface. Linings shall be made of a friction material, whose coefficient of friction shall be tested and the difference between static and dynamic friction shall be less than 20 %.

Name of part	Material	Dimensions mm
Base 1001	Structural steel	<p>Technical drawing of a mechanical part, Base 1001, showing dimensions and features. The drawing is a perspective view of a complex, angular metal base. Key dimensions include overall length of 200 mm, width of 120 mm, and a height of 140 mm. The part features a series of holes: 8 x Ø17,5 along the bottom edge, 4 x Ø20,5 along the top edge, and 2 x Ø16,5 along the side edge. A series of 10 x Ø6 holes are also present. The drawing includes various chamfers and fillets, with dimensions such as 55, 90, 140, 30, 10, 35, 4,5, 120, 38, 15, 70, 10, 50, 140, 200, 30, 25, 70, 270, 4 x 4,5 (30), and 100 (10x). The material is specified as Structural steel.</p>
